Final Project Check In 1

Github: <https://github.com/ziowm/FFHelper>

What has been working?

So far, we have decided on the exact dataset we are planning on using and have been able to find all the information we need to be successful in completing this project. We have also been able to come up with many function names, and definitions, and know the direction we plan to take when coding our project in the upcoming week. We have also been able to come up with original formulas that would allow us to find the correlation between fantasy production to translate into real-world offensive and defensive team efficiency.

What has not been working?

We currently have to process and sort through the dataset and export it as a .csv file so that we are able to read it through the Python program we plan on coding. This will take a few days, but we plan on remaining on schedule. We also have to consider implementing realtime stats and must come up with a solution in order to implement this in our program.

What can you do differently to address what hasn't been working?

We should definitely complete the sorting of the dataset so that we can begin programming. Once we begin programming, everything else should fall into place, because we have a clear sense of direction as to where we want to take this project. If we have any questions or concerns, we will speak to a TA or the professor for guidance.
